Flow data

The graphs illustrate the change or “droop” in outlet pressures as the flow rate increases. Droop refers to the reduction in outlet pressure that arises from an increase in flow rate through the regulator.

WARNING: Flow curves are generated from data collected under laboratory conditions which may not be fully representative of real-world applications. Real-world valve performance may vary from the curve presented. Tests are conducted using air at 20°C with an assumed fixed density of 1.2 kg/m³.

Failure flow

Failure flow for a range of inlet pressures.
