The graph illustrates the relationship between the speed of the motor (N in min^{-1}) and the number of steps per revolution. The y-axis represents 'Steps per revolution' with values ranging from 16,384 to 262,144. The x-axis represents 'Speed N [min^{-1}]' with values from 0 to 12,000. The curve shows that as the speed increases, the number of steps per revolution decreases, following a non-linear relationship.

SSI data format signatures

40 Mbit/s

SSI data rate	Error bit position
40 Mbit/s	1-16

27 Mbit/s

SSI data rate	Error bit position
27 Mbit/s	1-16

20 Mbit/s

SSI data rate	Error bit position
20 Mbit/s	1-16

Error bits

- **ERROR** flag message occurring at the time of false occurs during the packet building procedure will be indicated by the **ERROR** flag.
- **ERROR** Light source monitoring failure.
- **ERROR** Communication of the error of monitoring system. During the determination of the position, an error has occurred since the error has not been detected during the next data transmission.

The evaluation of the error bits has to be realized in the PLC.

The provided error data has to be used by the PLC completely.

Example

If the monitoring of the absolute encoder is set on 27 Mbit/s, 30 bits are provided by the evaluation of 13 data bits and 5 error bits. The error bit is able to monitor the error bits, the PLC has to be set on a monitoring of 13 bits. Then the error bits have to be read out by the PLC.

SSI data rate	Error bit position
40 Mbit/s	1-16

27 Mbit/s

SSI data rate	Error bit position
27 Mbit/s	1-16

The evaluation of the error bits has to be realized in the PLC.

The provided error data has to be used by the PLC completely. The multitrans resolution is fixed on 12 bits.

Example

If the monitoring of the absolute encoder is set on 27 Mbit/s, 30 bits are provided by the evaluation of 27 data bits and 5 error bits. The error bit is able to monitor the error bits, the PLC has to be set on a monitoring of 27 bits. Then the error bits have to be read out by the PLC.
